

FERN'S BIOACTIVE FOREST

Porcellio Scaber "Party Mix"

Size – 6mm – 4.5cm

Lifespan – 1 – 2 years approx

Temps – This species can handle environments dry, humid, hot, or cold, but they prefer warmer temps between 70 - 85 F

Humidity – 60% with a moisture gradient ranging from half damp/half dry

Food – Leaf litter, rotting wood, veggies, fish food(careful of mites), and Custodian fuels.

These captive bred Isopods are a beautiful throwback Thursday of isopods. Porcellio scaber 'Party Mix' is a collection of different color morphs of P. scaber, and is where many of the color forms present in today's hobby originate. Party Mix scaber Isopods are large, active, and very colorful. This species is also super fast! If you're looking to keep these isopods outside of a vivarium you won't be disappointed as they are a delight to watch. They produce colors ranging from white to orange to grey as well as a mix of all three. This is where many of the dalmatian morphs derived from. Highly variable, these isopods pop out a variety of common scaber morphs. In rare cases, starving isopods may attempt to consume the carapace of freshly molted invertebrates or even gnaw on small or delicate reptiles or amphibians. We strongly recommend providing supplemental food to your clean up crew in the enclosure. Reproducing quickly - they make great pets!
